

Owen Trueblood

10XBeta

Owen Trueblood is an engineer with experience across many aspects of electrical and software engineering. In his consulting practice for hardware startups, he assisted the earliest stages of product development, designing and implementing electronics, firmware, and software applications to bring a product idea from concept through prototyping, manufacturing, and into the hands of initial users. As an artist, Owen seeks to illuminate narrative worlds hidden in byzantine systems. From designing handheld electronic musical instruments to writing real-time control software for applying industrial robot arms to painting and writing compilers for esoteric processor architectures Owen finds endless fascination in the machines that run our high tech world.
